

Large Hadron Collider at CERN. Collide two protons head on. Each proton has $E = 3.5 \text{ TeV}$
Interested in process $pp \rightarrow X + \text{stuff}$ followed by $X \rightarrow \mu^+ \mu^-$.

- Select collisions where we detect a μ^+ and a μ^- .
- Measure the 3-momenta of both muons. Construct the 4-momentum from $E^2 = P^2 + M_\mu^2$.
- Add the two 4-momenta
- Take the square of the resulting 4-momentum. (This gives a number!)
- Take the square-root of the result
- If the two muons come from decay of X , this will be $= M_X$ (within resolution effects)

More data.....

Same idea now, but look for the Higgs boson.

Two “decay channels”

1. $H \rightarrow \gamma\gamma$
2. $H \rightarrow \mu^+\mu^+\mu^-\mu^-$ or $\mu^+\mu^-e^+e^-$ or $e^+e^+e^-e^-$

TIME Person of the Year

THE CANDIDATES

The Higgs Boson

By Jeffrey Kluger | Monday, Nov. 26, 2012

Simulation of a Higgs-Boson decaying into four muons, CERN, 1990.

What do you think?

Should **The Higgs Boson** be TIME's Person of the Year 2012?

19.74% Definitely 80.26% No Way

Take a moment to thank this little particle for all the work it does, because without it, you'd be just inchoate energy without so much as a bit of mass. What's more, the same would be true for the entire universe. It was in the 1960s that Scottish physicist Peter Higgs first posited the existence of a particle that causes energy to make the jump to matter. But it was not until last summer that a team of researchers at Europe's Large Hadron Collider — Rolf Heuer, Joseph Incandela and Fabiola Gianotti — at last sealed the deal and in so doing finally fully confirmed Einstein's general theory of relativity. The Higgs — as particles do — immediately decayed to more-fundamental particles, but the scientists would surely be happy to collect any honors or awards in its stead.
